PV Magazine Webinar

Dec. 18, 2019

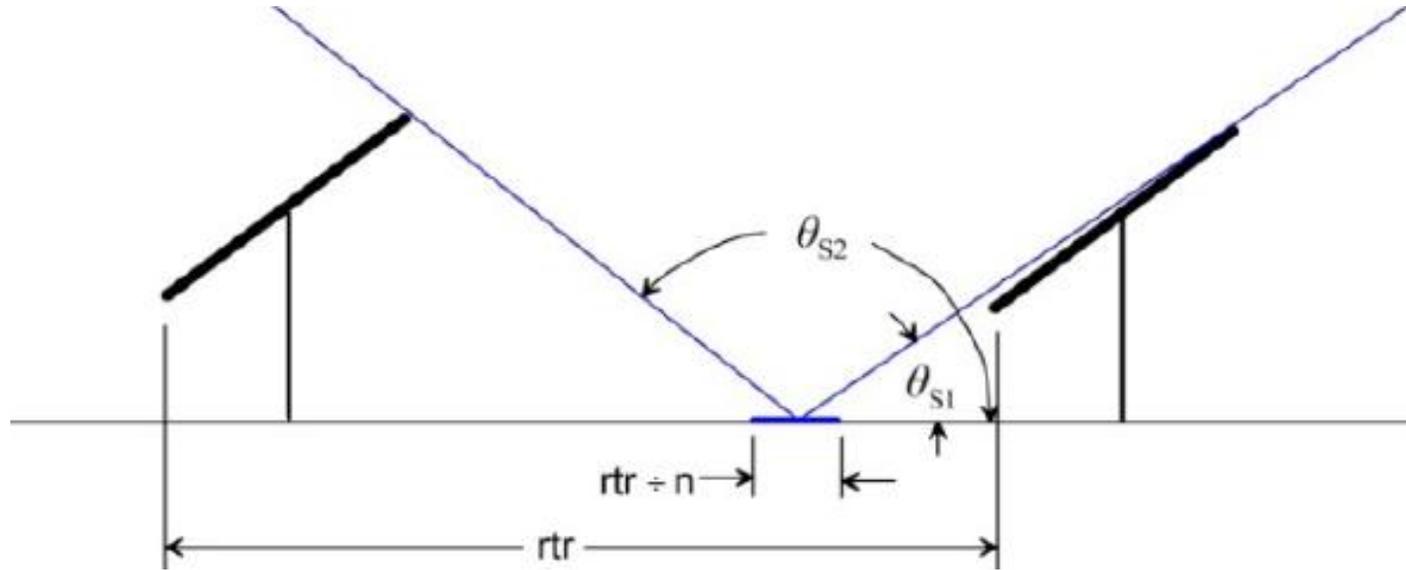

Bifacial performance modeling

The PV industry is set for rapid uptake of bifacial PV if key barriers are eliminated

- accurate performance models,
- standards around the rating of bifacial modules, and
- accurate assessment of site albedo.
- documented bifacial gains in the field

View Factor Model for Rear Irradiance

Simple

basic

Fast

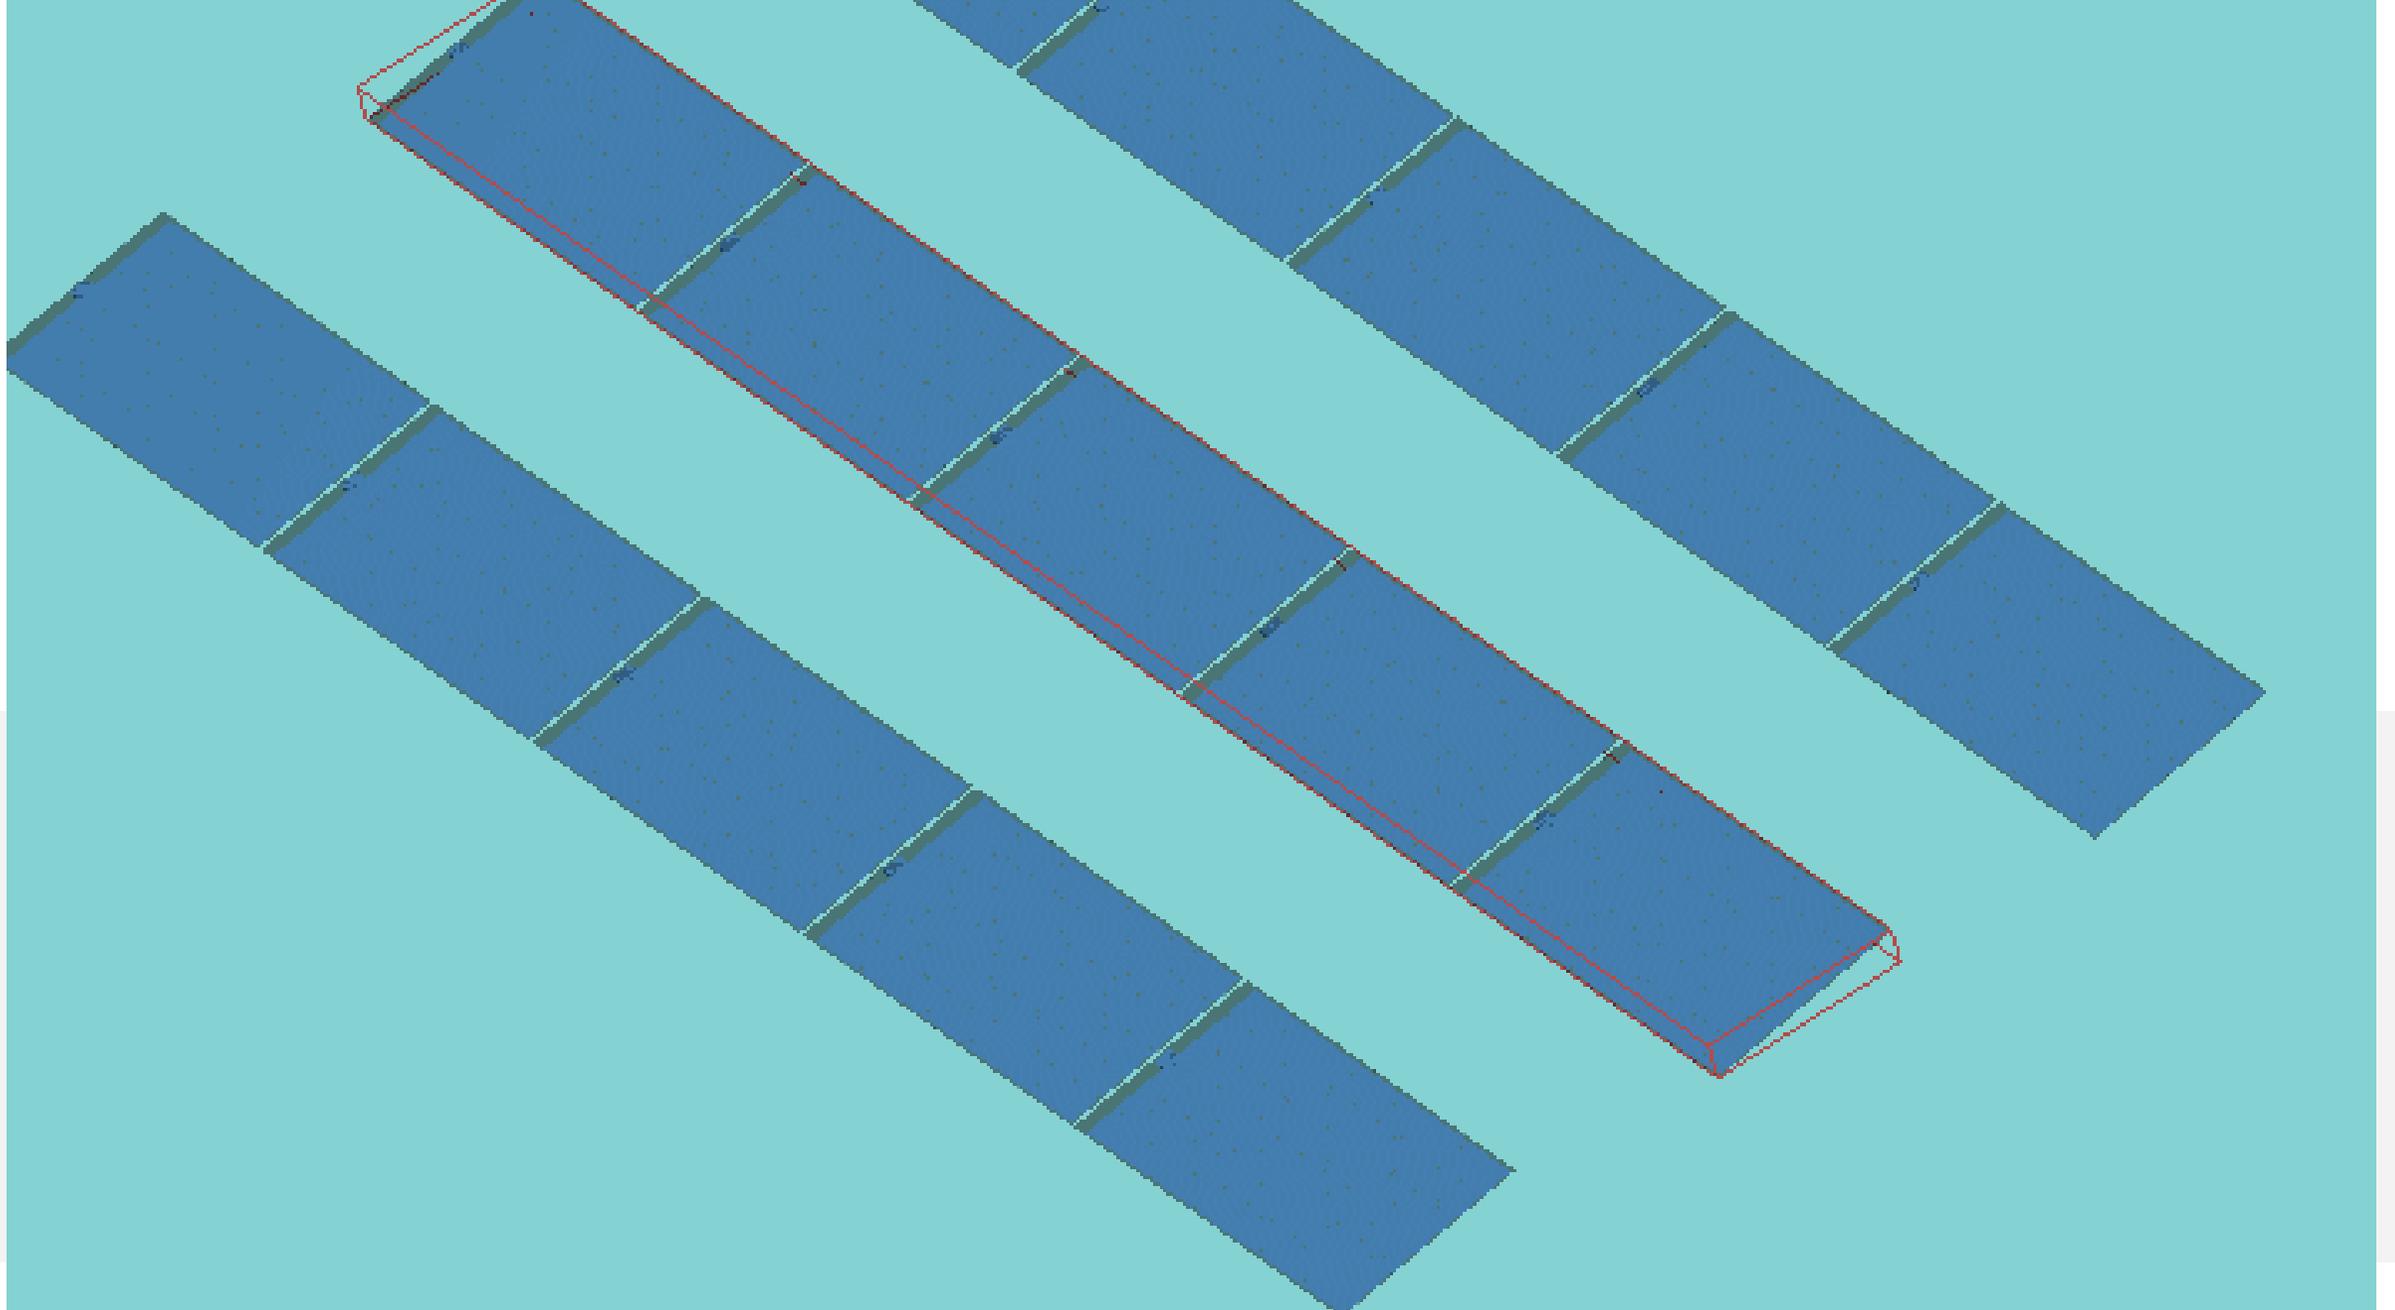

computationally
inexpensive

Common

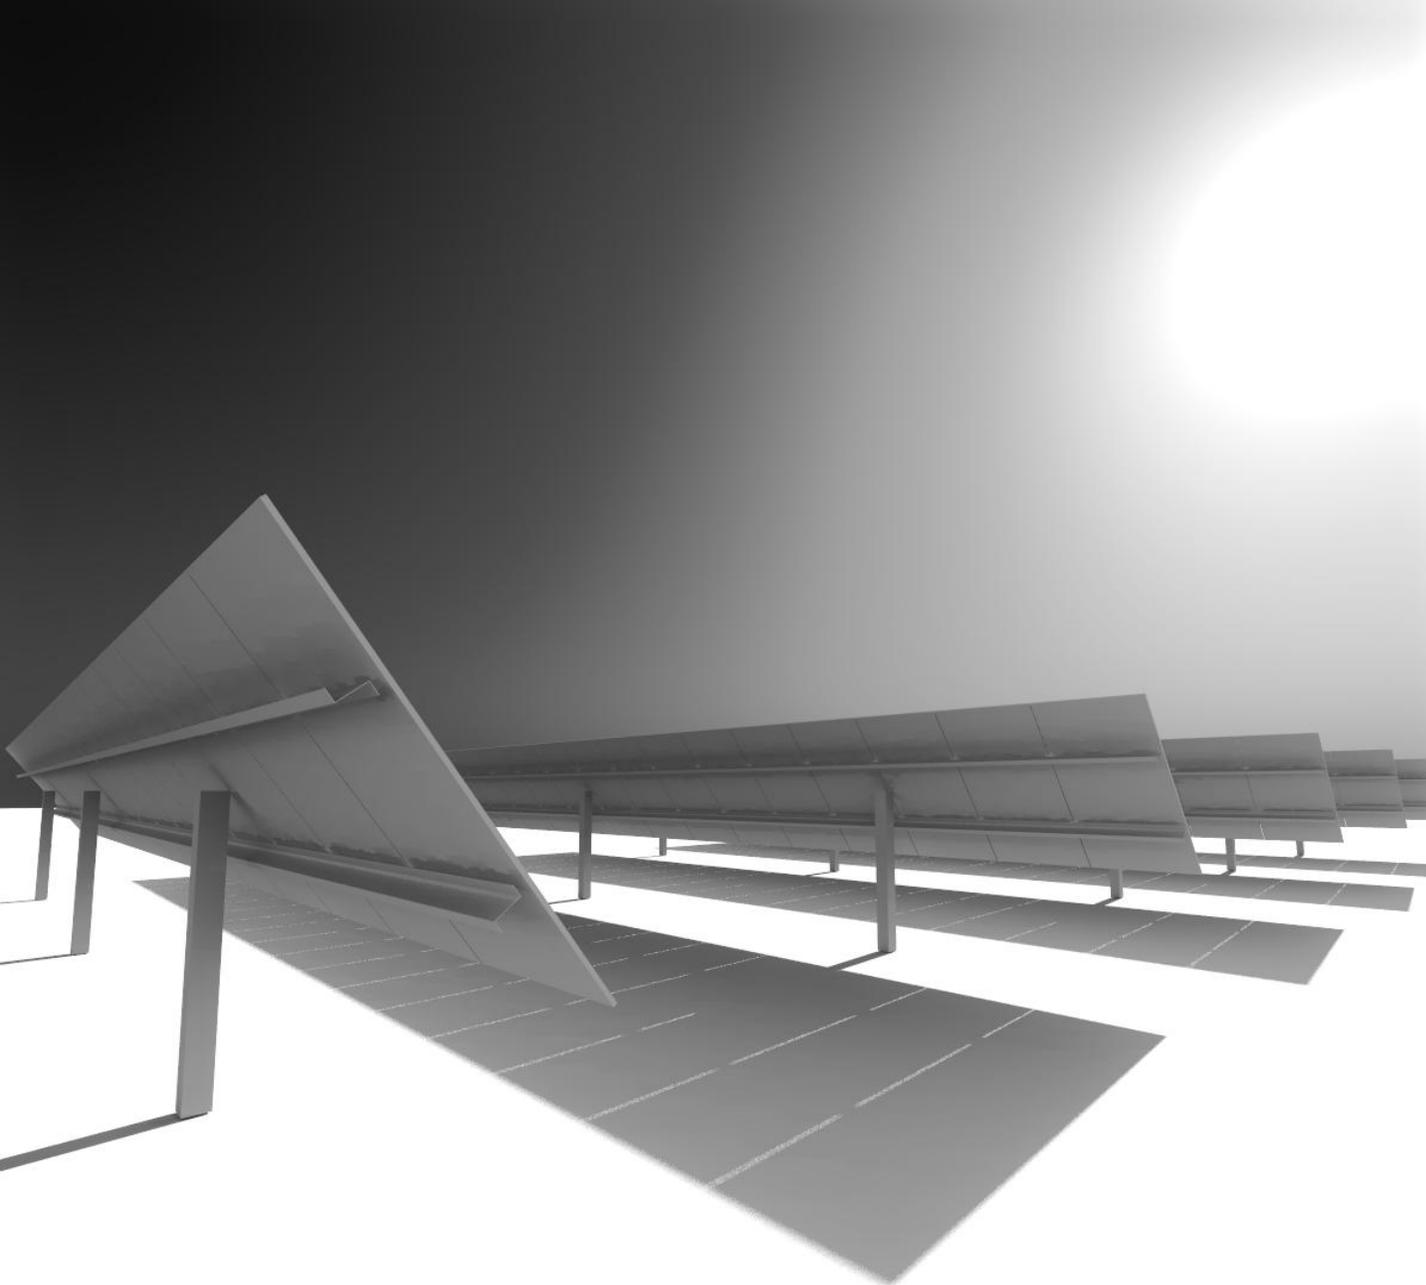

Behind SAM, PVSyst,
bifacialvf and others

Simple

basic
geometry

Other option: Raytracing Software

Raytrace benefits:

- Any size array
- Sample any module
- Evaluate edge effects
- Complicated geometries
 - Modules
 - Racking
 - Obstructions
- Evaluate shading
- Evaluate electrical mismatch
- Open source
- Dedicated visual interface
- Validated

Cons:

- Complexity
- Run-times

← Visual interface

← Training

← HPC integration

← Simplified models

| PVSyst | Features | NREL VF / SAM | bifacial radiance |
|--------|--|---|-------------------|
| | 2D simulation of sheds | | (3D, actually) |
| | Monthly albedo values | | |
| | Hourly/Instantaneous albedo values | | |
| | Circumsolar anisotropy for back side diffuse | Perez model for rear irradiance, which includes circumsolar | |
| | IAM for backside reflections | Apply IAM to both diffuse, reflected and direct-beam irradiance on the front and rear | |
| | Diffuse shading w/trackers | / | |
| | Irradiance non-uniformity | / | |
| | Spectral-corrected backside irradiance | | |
| | Specular reflections | | |

Updated from Itai Suez, PV Performance & Reliability Workshop, Feb. 2019

Irradiance non-uniformity is addressed in PVSyst and SAM as part of the correction factors that can be applied to annual rear irradiance.

SAM has a known issue with front-side diffuse shading in trackers deactivating for hours that have backtracking. Rear-side diffuse shading is still considered by the model. Also, this issue is being fixed on the next release (December 2019).

bifacial_radiance

Open Source toolkit for working with RADIANCE for the
ray-trace modeling of Bifacial Photovoltaics

Available on: https://github.com/NREL/bifacial_radiance

Documentation: <https://bifacial-radiance.readthedocs.io>

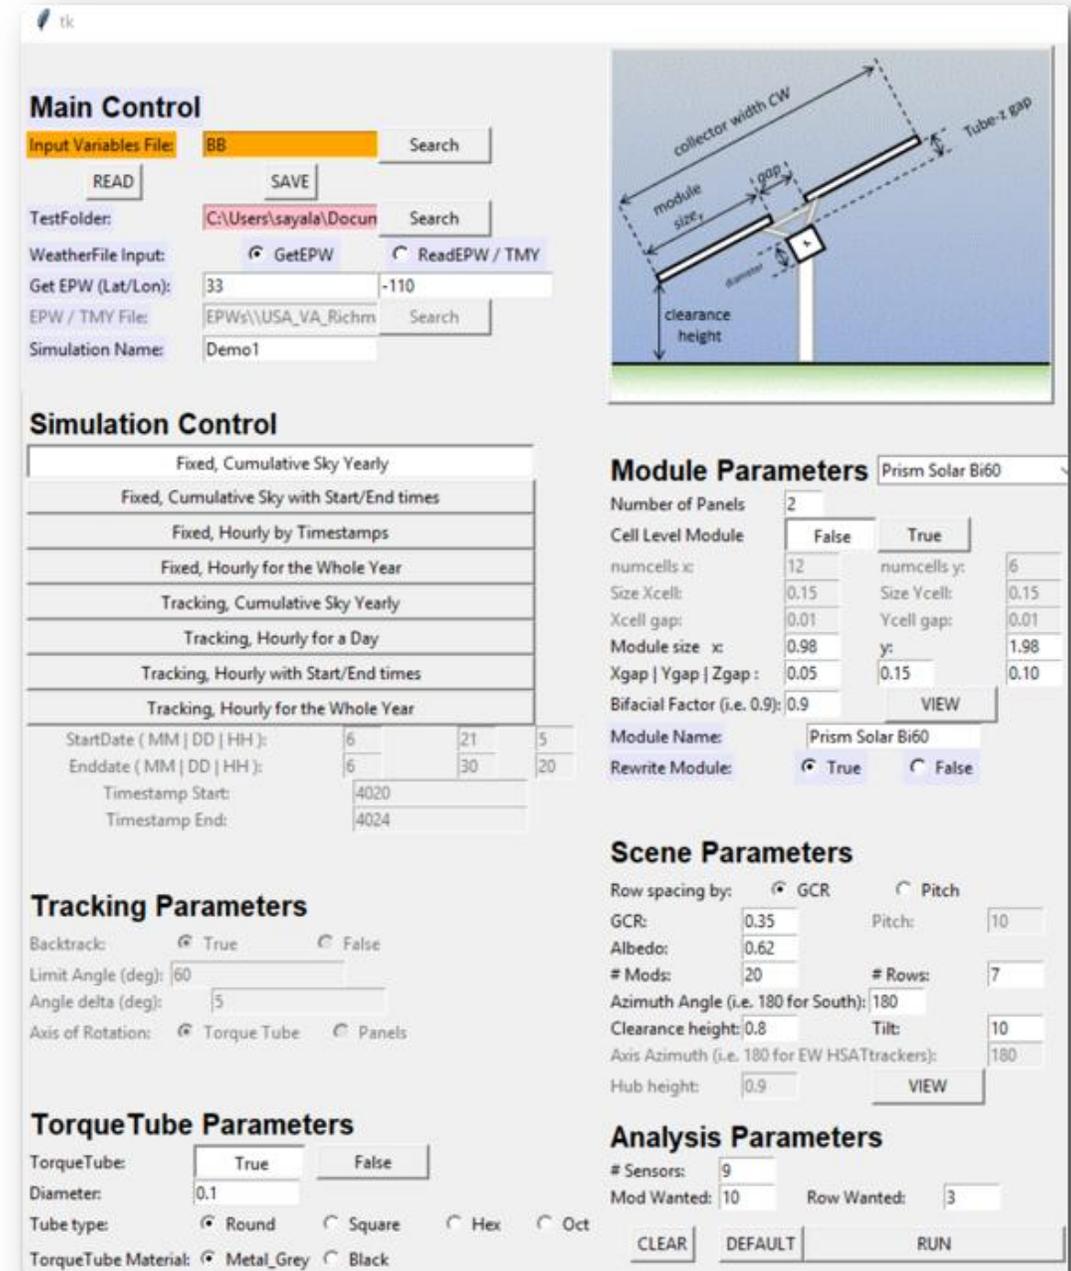

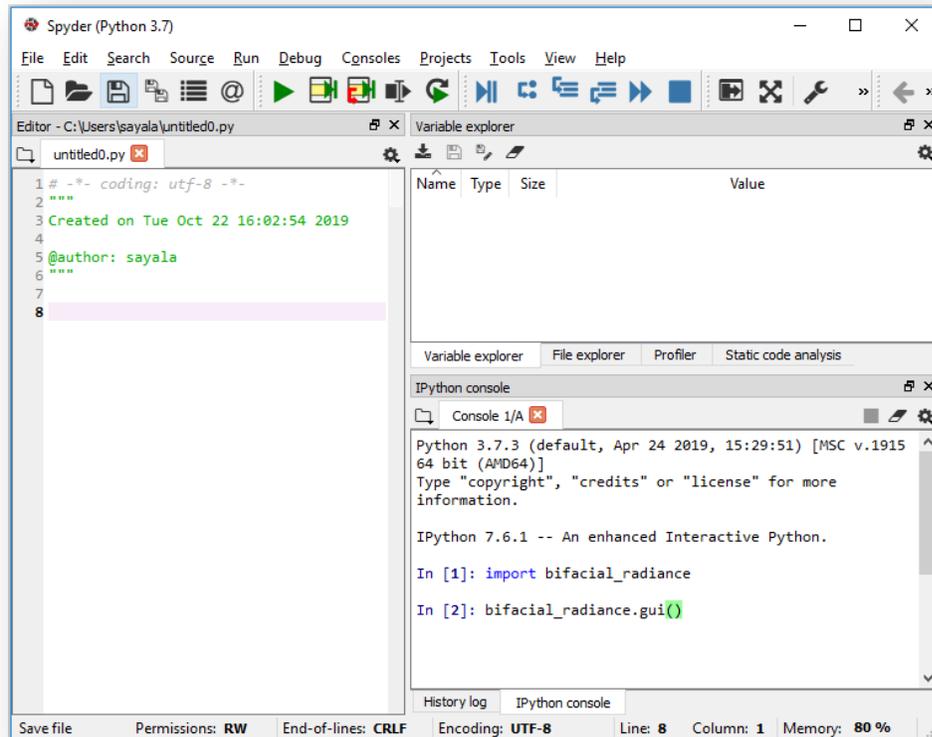

Installation: <https://youtu.be/4A9GocfHKyM>

Training: <https://youtu.be/1X9L-R-RVGA> | <https://www.nrel.gov/docs/fy20osti/75218.pdf>

V. 0.3.3.1 (10/16/19)

Python Interface

```
import bifacial_radiance  
bifacial_radiance.gui()
```

On electrical mismatch...

- bifacial_radiance provides irradiance results at the module.
- Coupled to **SUNPOWER[®]** PVMismatch for simple electrical modeling.
- Working on further streamlining and result interpretation, as well as reduced-order models.

In the meantime, we have tutorials

High Performance Computing **Integration**

Yearly hourly simulations take
4 days on a PC,
HPC RUNS in 1 Minute!

Conclusions

- Energy gain on bifacial systems depends on the site configuration and surface albedo. Models like SAM, PVSyst, and bifacial_radiance can assist with system design and power estimation.
- Model validation is underway, and current VF software (SAM, PVSyst) appears to be conservative relative to measured rear irradiance.
- Raytrace softwares, such as the open source bifacial_raytrace, allow for more detailed simulations, which provide better agreement with results. It can help calculate particularities of your system (i.e. shading factor and electrical mismatch), and also to develop reduced-order models.
- Computationally intensive? Try HPC... or AWS (in theaters near you in 2020)
