# Mounting big modules on rooftop PV

**Jason McCabe**

Senior product manager UK & EU  
Clenergy

**Can Kökten**

Vice President  
Clenergy

# Welcome!

**Do you have any questions?** ? 

Send them in via the Q&A tab.  We aim to answer as many as we can today!

You can also let us know of any tech problems there.

**We are recording this webinar today.** 

We'll let you know by email where to find it and the slide deck, so you can re-watch it at your convenience.  

# Our Strengths

## 16 Years of Experience in Mounting Systems

- 20 GW of Worldwide installations
- No.1 in Australia last 10 years
- 65000 Installations in Germany
- 30000 Installations in UK

## Strong after sales support(Win-Win)

- Establishment of close contact with Customers
- Permanent improvements based on customer's feedbacks:
  - New Product development for new market entry
  - Logistics
  - Packaging

## R&D Competence

- International Background
- Owner of Patent's = 66

# Ascent

- **Roof Friendly Design**
  - the non-penetrative solution for flat roofs with 10 and 15° set angle
  - No penetration to the roof structure- 100% waterproof
- **Ballast Optimized**
  - Aerodynamic optimized construction
  - Wind tunnel Tested
  - Optimum ventilation for maximum energy output
- **Less Labor-1 Screwdriver enough for MW's**
  - Click connections between Legs and Bases
  - no tools are used during the Legs and Bases and
  - preassembled

# SolarRoof Pro 2.0

SRPII is a highly adjustable roof-mounting solution suitable for most types of pitched roofs

One Tool Installation

High Flexibility

Rail

Universal Clamp

Interface

# 4 Way Adjustable Hook

## Flexibility on the construction

- Patented roof hook, can adjust the whole system in four ways and multiple directions
- Suitable for tiles with different thickness and length
- Unevenness on the roof surface will be compensated and straight installation will be enabled for installers

# 4 Way Adjustable Hook

## Flexibility on the construction

Vertical and Horizontal Installation in the same Kit

- Saving Effort
- Easy Logistics Management

# Quality Guaranty

TÜV-Certified

WARRANTY

Mechanics  
Calculation & Analysis

# Interesting Facts

**pv magazine**

**PV-ezRACK®**

Back in September 2021 PV magazine shared an article regarding some prominent module producers agreeing on a standardization of module sizes. This was actually a follow up to an earlier white paper on the topic, after calls from other prominent module producers started to call for a standardization because clearly modules are getting more and more powerful and there was a risk of modules constantly getting bigger and bigger .

## MECHANICAL DIAGRAMS

## SPECIFICATIONS

Cell	Mono
Weight	21.5kg±3%
Dimensions	1722±2mm×1134±2mm×30±1mm
Cable Cross Section Size	4mm² (IEC) , 12 AWG(UL)
No. of cells	108(6x18)
Junction Box	IP68, 3 diodes
Connector	MC4(1000V) MC4-EVO2(1500V)
Cable Length (Including Connector)	Portrait: 300mm(+)/400mm(-); Landscape: 1200mm(+)/1200mm(-)
Packaging Configuration	36pcs/Pallet, 936pcs/40ft Container

**Hi-MO 5m**

**LR5-54HIH 400~420\*\***

<b>21.5%</b> MAX MODULE EFFICIENCY	<b>0~3%</b> POWER TOLERANCE	<b>&lt;2%</b> FIRST YEAR POWER DEGRADATION	<b>0.55%</b> YEAR 2-25 POWER DEGRADATION	<b>HALF-CELL</b> Lower operating temperature
--	-----------------------------------	--	--	---

## Additional Value

## Mechanical Parameters

Cell Orientation	108 (6×18)
Junction Box	IP68, three diodes
Output Cable	4mm², L200mm
Connector	MC4-EVO2
Glass	Single glass, 3.2mm coated tempered glass
Frame	Anodized aluminum alloy frame
Weight	20.8kg
Dimension	1722×1134×30mm
Packaging	36pcs per pallet / 216pcs per 20' GP / 936pcs per 40' HC

## Engineering Drawings

## Packaging Configuration

(Two pallets = One stack)  
31pcs/pallets, 62pcs/stack, 496pcs/ 40HQ Container

## Electrical Performance & Temperature Dependence

## Mechanical Characteristics

Cell Type	N type Mono-crystalline
No. of cells	156 (2×78)
Dimensions	2465×1134×35mm (97.05×44.65×1.38 inch)
Weight	30.6 kg (67.46 lbs)
Front Glass	3.2mm, Anti-Reflection Coating, High Transmission, Low Iron, Tempered Glass
Frame	Anodized Aluminum Alloy
Junction Box	IP68 Rated
Output Cables	TUV 1×4.0mm² (+): 400mm, (-): 200mm or Customized Length

## Interesting Facts

**pV magazine**

 **PV-ezRACK®**

New standardised approach gives  $54 \times \text{cell} = 1722\text{mm} \times 1134\text{mm}$  /  $72 \times \text{cell} = 2278\text{mm} \times 1134\text{mm}$  /  $78 \times \text{cell} = 2465\text{mm} \times 1134\text{mm}$ . Whilst this is welcome news, and it of course makes future product development of mounting structures somewhat clearer it does create some initial issues.

- For example most existing wind tunnel studies for flat roof systems had been conducted on traditional sized modules.
- Most mountings components, support rail for example had been designed for modules up  $<1000\text{mm}$  in width and  $<2000\text{mm}$  in length.
- Project planning can even be affected with bigger modules. In an ideal world everyone would use the  $1722\text{mm} \times 1134\text{mm}$ , however we know that this simply is not the case. It could be that part of a roof mounted array could be in roof zones with higher wind forces, it could also mean more fixings are necessary to support larger array areas.
- I would like to share two small examples of why correct mounting planning is absolutely critical because of these topics.

## Interesting Facts

# Interesting Facts

## Example x 1

- A standard residential building with a 8m building height with a 30\* roof pitch switching between terrain category II - III ( or city / exposed countryside ) we have the following results.

Wind Load 0.52 - 0.97KN/ m2 Snow Load 0.47 - 0.69KN/m2

Wind Load 0.52 - 0.89KN/ m2 Snow Load 0.50 – 0.92KN/m2

Wind Load 0.42 – 0.72KN/ m2 Snow Load 0.90 - 2.2KN/m2

Wind Load 0.75 - 1.5KN/ m2 Snow Load 0.57 - 1.2KN/m2

Actually apart from these small examples above, you find across Europe we have wind loads from 0.37 – 1.6KN/m2 and snow loads between 0.18 – 2.5KN/m2 dependent on the location / terrain / building height / and a number of other factors the values change significantly. Not only do the values change significantly across Europe, but even in the same Country the location changes the results considerably.

# Interesting Facts

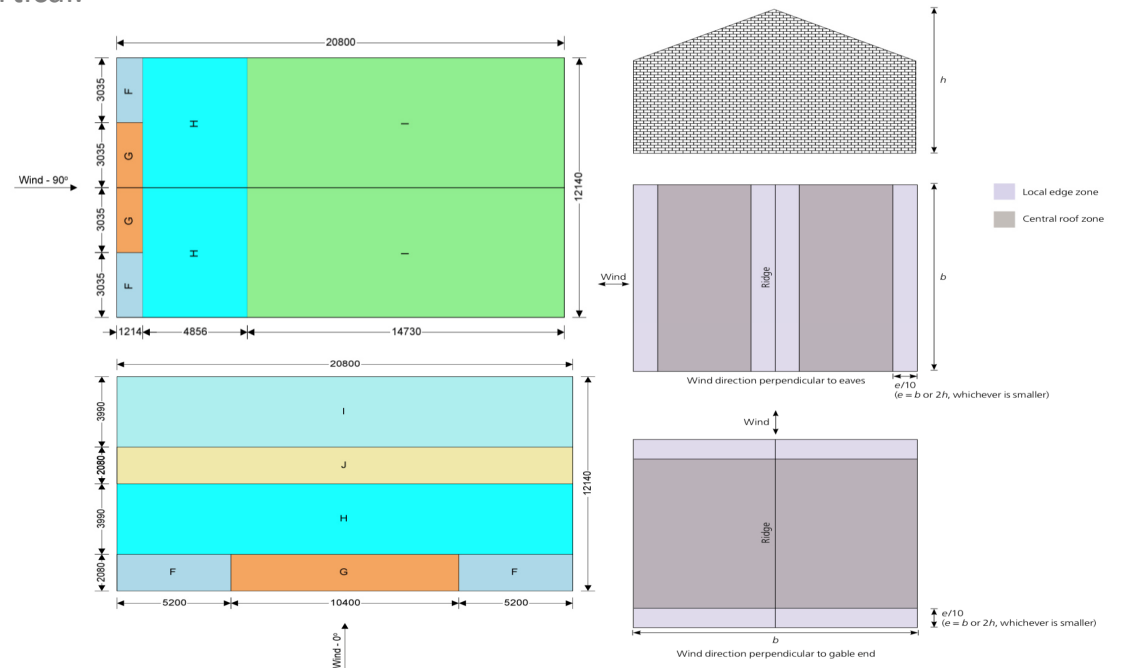

Clearly with such a vast range in the difference of wind and snow loads a standard configuration of fixing supports and rail cannot be the same, also considering the module may be 1.95m<sup>2</sup> / 2.58m<sup>2</sup> / 2.79m<sup>2</sup>. It would absolutely be project specific and with the following calculations it can be proven that different module positions in different roof zones have different wind forces to resist and the potential snow load both horizontal and vertical.

$$\text{Wind} = W = q_p C_{p, \text{net}} / F_v = 1 / \sum n \text{ modules } w_{\text{Aref}} \gamma_f$$

$$\text{Snow} = S_k v = \mu_1 \chi C_e \chi C_t \chi S_k \chi \cos^a$$

$$S_k h = \mu_1 \chi C_e \chi C_t \chi S_k \chi \sin^a$$

Therefore planning correctly is absolutely critical because otherwise it is a gamble you either have to go overkill and utilise as many fixings as possible or even worst, you do not use enough fixings for the system to be stable in the event of high loads.

## Interesting Facts

### Example x 2

- A typical commercial trapezoidal roof, very common across the globe but in Europe we have a significant differences in the distance between the raised ribs. Modules very often are positioned in landscape orientation. With short rails 120mm -150mm in length which clamp on the long side of the module.

Note the position of the fixing supports clamping on the long side of the module

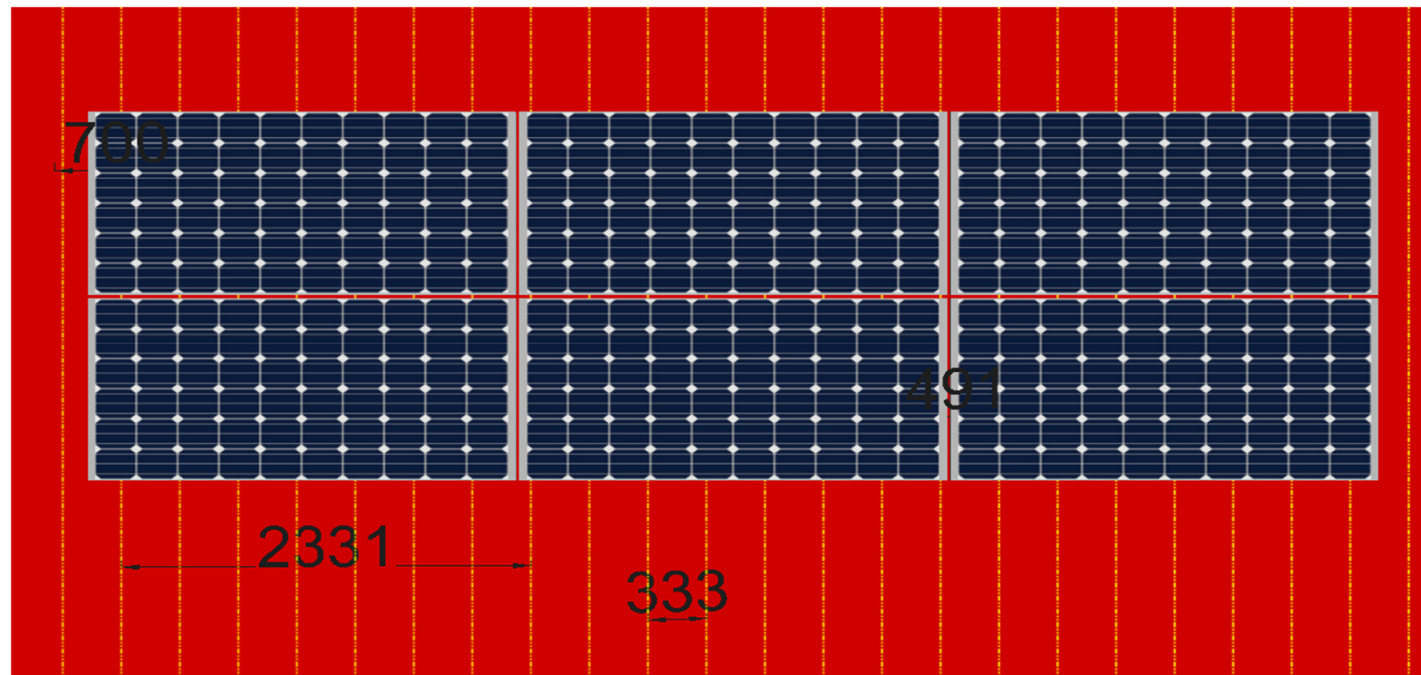

This has been the case for many years, but this was in the days of course when modules were on average 1.58m<sup>2</sup> or around 1.65m in length ... clearly a module length of 1722mm should not pose to much of a problem .. However we are now talking about module lengths of 2278mm / 2465mm .. Are we comfortable in the industry with this ?

## Interesting Facts

### Example x 2

- Below are 6 x modules in landscape the modules are around just under 2.4m in length and they are attached to a trapezoidal sheet roof that has raised ribs at 333mm centres.

## Interesting Facts

### Example x 2

- By using the normal configuration of fixings that I have used since 2010 I now have significant problems, because no matter where I move the PV array, either to the left or to the right because my anchor points need to attach to the vertical rib sections at 333mm centres It will absolutely create some mounting issues ...

# Interesting Facts

## Example x 2

- Excessive cantilevers and generally speaking all the modules have a lot of unsupported area particularly as we have between 2.58 – 2.79m<sup>2</sup> per module.

As we have seen in the two small examples careful consideration should be applied to a PV mounting system design when using large format modules. But when planned correctly the risk is minimised and fully stable. If in any doubt always consult the manufacturer of the racking system and module producer.
